

# **Enterprise Executive Summary & Strategy Topology\n## ICT 0DTE Multi-Strategy Algorithmic Trading Platform\n\n### 1.**

## **Business Objective & Scope\nThe ICT 0DTE Multi-Strategy**

**Algorithmic Trading Platform is an autonomous, institutional-grade quantitative execution system designed for intraday volatility harvesting and defined-risk options trading. Operating across zero-days-to-expiration (0DTE) lifecycles, the platform eliminates single-strategy rigidities by dynamically allocating between Credit Spreads (capturing accelerated theta decay in range-bound or mean-reverting regimes) and Debit Spreads (capturing momentum breakouts around Volume Profile migration nodes).\n\n### 2. Core**

**Architectural Pillars\nMulti-Strategy Hybridization:**

**Simultaneous runtime evaluation of short-premium credit spreads (Bull Put / Bear Call) and directional debit spreads (Bull Call / Bear Put).**\n **Multi-Ticker Universe: Asynchronous parallel scanning across 10-20 top-tier S&P 100 liquid equities and index benchmarks (SPX, SPY, QQQ, AAPL, MSFT, NVDA, TSLA, AMZN, GOOGL, META, AMD, NFLX, JPM, UNH, V, HD).**\n **Strict Risk Governance: Portfolio-wide concurrency limits (max 1-2 active positions), minimum option contract cost threshold (\$0.70+), dynamic 50% profit-taking trailing stops, and hard market timing cutoffs.**\n **Persistent Audit Logging: Transactional SQLite/ PostgreSQL audit ledgers (data/trades.db) combined with GCS state persistence and real-time Streamlit telemetry.**
